ACULAR® Eye Drops

NAME OF THE DRUG
Non-proprietary name: ketorolac trometamol.

Chemical Structure:

![Chemical Structure Image]

Chemical Name: (±)-5-Benzoyl-2,3-dihydro-1H-pyrrolizine-1-carboxylic acid compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1)

Empirical Formula: C₁₉H₂₄N₂O₆  Molecular Weight: 376.41
CAS No: 74103-07-4  pKa: 3.54

DESCRIPTION
Ketorolac trometamol is a white to off-white crystalline substance, which is a racemic mixture. It may exist in three crystalline forms, all of which are equally soluble in water.

Ketorolac trometamol (ACULAR®) eye drops is a clear, colourless to pale yellow, sterile, isotonic aqueous solution.
Active: ketorolac trometamol 5 mg/mL
Excipients: benzalkonium chloride 0.01% (w/v), disodium edetate 0.1% (w/v), octoxinol 40, sodium chloride, sodium hydroxide/hydrochloric acid (to adjust pH) and purified water.

PHARMACOLOGY
Class: Ketorolac trometamol is a member of the pyrrolo-pyrole group of non-steroidal anti-inflammatory drugs for ophthalmic use.

Pharmacological actions.
Ketorolac trometamol is a nonsteroidal, anti-inflammatory agent demonstrating analgesic and anti-inflammatory activity. It is believed to inhibit the cyclo-oxygenase enzyme essential for prostaglandin biosynthesis. Ocular administration of ketorolac trometamol reduces prostaglandin E₂ levels in the aqueous humour. Ketorolac trometamol given systemically does not cause pupil constriction. Results from clinical studies indicate that ACULAR® eye drops have no significant effect upon intraocular pressure.

Pharmacokinetics.
Two drops (0.1 mL) of 0.5% ACULAR® eye drops instilled into the eyes of patients 12 hours and 1 hour prior to cataract extraction achieved measurable levels in 8 of 9 patients’ eyes (mean ketorolac concentrations 95 ng/mL aqueous humour, range 40-170 ng/mL). One drop (0.05 mL)
of 0.5% ketorolac trometamol solution was instilled into one eye and one drop of the vehicle into
the other eye three times a day for 21 days in 26 normal subjects.

Only 4 of 13 subjects had detectable amounts of ketorolac in their plasma (range 10.7 to 22.5
ng/mL) after 15 minutes at Day 10 during topical ocular treatment. Average peak plasma level
following intramuscular administration of 30 mg ketorolac trometamol was 2.2 µg/mL 50
minutes after administration.

Clinical Trials.

Allergic conjunctivitis
A total of 203 patients with seasonal allergic conjunctivitis were evaluable for efficacy in two
randomised, controlled clinical trials of ACULAR® (ketorolac) eye drops against placebo. The
patients who received ketorolac demonstrated significant decreases in itching, and conjunctival
inflammation over the 7 day treatment period.

Post-operative inflammation
A total of 206 patients who had undergone cataract surgery participated in two randomised,
controlled clinical trials of ACULAR® (ketorolac) eye drops against placebo. The patients who
received ketorolac showed significantly greater decreases in anterior chamber cells and anterior
chamber flare over the two weeks of treatment. 39% of ketorolac patients achieved a zero score
for anterior cells and flare after 2 weeks of treatment compared to 12% of placebo patients.

INDICATIONS
ACULAR® eye drops are indicated for the short term (2-4 weeks) relief of symptoms of seasonal
allergic conjunctivitis.
ACULAR® eye drops are also indicated for the short term (2-4 weeks) prophylaxis and reduction
in inflammation in patients undergoing cataract extraction.

CONTRAINDICATIONS
ACULAR® eye drops are contraindicated in patients hypersensitive to any of the components of
the medication.

The potential exists for cross sensitivity to acetylsalicylic acid and other nonsteroidal anti-
inflammatory medicines. ACULAR® eye drops are contraindicated in patients who have
previously exhibited sensitivities to these drugs.

PRECAUTIONS
Patients with bleeding tendencies: With some nonsteroidal anti-inflammatory drugs a potential
exists for increased bleeding time due to interference with thrombocyte aggregation. There have
been reports that ocularly applied nonsteroidal anti-inflammatory drugs may cause increased
bleeding of ocular tissues (including hyphemas) in conjunction with ocular surgery. ACULAR®
eye drops should be used with care in patients with known bleeding tendencies, or in patients
who are receiving other medications which may prolong bleeding time, or patients with a known
history of peptic ulceration.

Bronchospasm: There have been post-marketing reports of bronchospasm or exacerbation of
asthma in patients, who have either a known hypersensitivity to aspirin/non-steroidal anti-
inflammatory drugs or a past medical history of asthma associated with the use of ACULAR®,
which may be contributory. Caution is recommended in the use of ACULAR® in these
individuals.
Delayed Healing: All topical nonsteroidal anti-inflammatory drugs (NSAIDs) may slow or delay healing. Concomitant use of topical NSAIDs and topical steroids may increase the potential for healing problems.

Corneal Effects: Use of topical NSAIDs may result in keratitis. In some susceptible patients, continued use of topical NSAIDs may result in epithelial breakdown, corneal thinning, corneal erosion, corneal ulceration or corneal perforation. These events may be sight threatening. Patients with evidence of corneal epithelial breakdown should immediately discontinue use of topical NSAIDs and should be closely monitored for corneal health.

Topical NSAIDs should be used with caution in patients with complicated ocular surgeries, corneal denervation, corneal epithelial defects, diabetes mellitus, ocular surface diseases (e.g., dry eye syndrome), rheumatoid arthritis, or repeat ocular surgeries within a short period of time as they may be at increased risk for corneal adverse events which may become sight threatening.

Post-marketing experience with topical NSAIDs also suggests that use more than 24 hours prior to surgery or use beyond 14 days post-surgery may increase patient risk for the occurrence and severity of corneal adverse events.

Ability to drive: As ACULAR® eye drops may cause transient blurring on instillation, caution is required with the use of hazardous machinery or driving, which are not recommended unless vision is clear.

Masking of Infections: In common with other anti-inflammatory drugs, ACULAR® eye drops may mask the usual signs of infections.

Use in Pregnancy: Category C
Ketorolac trometamol and its metabolites have been shown to pass into the foetus. Safety in human pregnancy has not been established. Not recommended in pregnancy.

Reproduction studies have been performed in rabbits and rats at oral doses of 3.6 and 10 mg/kg/day respectively. The results from these studies did not reveal any significant evidence of harm to the foetus. However, studies in rabbits have shown a small increase in the incidence of major vessel anomalies.

Use in Lactation: Ketorolac trometamol is excreted in the milk of lactating rats and rabbits, and has been detected in human breast milk. A peri/postnatal study in rats showed reductions in postnatal growth and survival of the offspring when ketorolac trometamol was administered to lactating rats at oral dose levels greater than 4.8 mg/kg/day. Thus, use of ketorolac trometamol in lactating mothers is not recommended.

Use in children: Safety and efficacy have not been demonstrated in children aged less than 12 years.

Carcinogenesis, Mutagenesis, Impairment of Fertility: An 18-month study in mice at oral doses of ketorolac trometamol of 2 mg/kg/day (equal to 1.2 times the human systemic exposure at the maximum recommended IM dose of 90 mg/day, based on AUC) and a 24 month study in rats at oral doses of 5 mg/kg (0.7 times the human parenteral AUC) showed no evidence of tumours.
Ketorolac trometamol was not genotoxic in a series of assays for gene mutations and DNA damage. Ketorolac trometamol did not cause chromosome breakage in the mouse micronucleus test in vivo at 1590 µg/mL, approximately 1000 times the average human plasma levels, but increased the incidence of chromosomal aberrations in Chinese hamster ovarian cells in vitro at higher concentrations.

Impairment of fertility did not occur in male or female rats at oral doses of 9 mg/kg (1.2 times human parenteral AUC) and 16 mg/kg (2.1 times the human parenteral AUC) respectively.

**Interactions with other drugs:** No specific clinical studies on interactions with other drugs have been conducted with ACULAR® eye drops. There were no reports in the controlled studies of interactions of ACULAR® eye drops with systemic and ophthalmic medications such as antibiotics, sedatives, beta blockers, carbonic anhydrase inhibitors, miotics, mydriatics, cycloplegics, local anaesthetics and corticosteroids.

Concomitant use of topical NSAIDs and topical steroids may increase the potential for healing problems.

**Information for Patients:** ACULAR® should not be administered while wearing contact lenses.

**ADVERSE REACTIONS**
In controlled clinical studies, the most frequently reported adverse events with the use of ACULAR® eye drops have been transient stinging and burning on instillation (eye pain). These events were reported by up to 40% of subjects treated with ACULAR®. Other adverse events reported in controlled clinical studies (at an incidence of >1%) included conjunctivitis (scratching, foreign body sensation, itching, erythema), local allergic reactions, superficial keratitis, corneal edema, eye infection, eye inflammation, eye irritation and hypersensitivity. Ptosis, blepharitis, photophobia, blurred vision, eye dryness, corneal lesion, iritis, and glaucoma were also reported in >1% of patients in some studies. Uncommon (>0.1% and <1%) adverse events reported were eye dryness, corneal infiltrates, ulcerative keratitis, visual disturbance and headaches.

In post-marketing experience ocular burning and stinging, ocular irritation, local allergic reactions, superficial ocular infections and superficial keratitis were the most frequently reported adverse reactions. Systemic allergic reactions have been reported very rarely. There have been post-marketing reports of bronchospasm or exacerbation of asthma in patients who have either a known hypersensitivity to aspirin/non-steroidal anti-inflammatory drugs or a past medical history of asthma, associated with the use of ACULAR® which may be contributory (see PRECAUTIONS).

**DOSAGE AND ADMINISTRATION**
**Seasonal allergic conjunctivitis:** The recommended dose of ACULAR® eye drops for the relief of symptoms of seasonal allergic conjunctivitis is one drop (0.25 mg) instilled in the eye four times daily. Treatment may be continued for up to four weeks.

**Post-operative inflammation:** The recommended dose of ACULAR® eye drops for the prophylaxis and treatment of inflammation in patients who have undergone cataract extraction is one to two drops (0.25-0.5 mg) four times daily, starting 24 hours before surgery and continuing for 2-4 weeks.
Discard any unused contents 28 days after opening the bottle.

**OVERDOSAGE**
There is no experience of overdosage by the ophthalmic route. If accidentally ingested, fluids should be taken to dilute the effects, if any.

**PRESENTATION**
ACULAR® (ketorolac trometamol) eye drops is supplied in white opaque plastic dropper bottles with dropper applicators.
Eye drops: 5 and 10 mL
Storage: Store below 25 °C. Protect from light.
Shelf life: 2 years

**POISONS SCHEDULE:** S4
